

ELB And Route 53

amazons cloud (Kumaraguru College of Technonology)

Scan to open on Studocu

You work for XYZ Corporation that uses on premise solutions and a limited number of systems. With the increase in requests in their application, the load also increases. So, to handle the load the corporation has to buy more systems almost on a regular basis. Realizing the need to cut down the expenses on systems, they decided to move their infrastructure to AWS.

Tasks To Be Performed:

1. Manage the scaling requirements of the company by:
 - a. Deploying multiple compute resources on the cloud as soon as the load increases and the CPU utilization exceeds 80%
 - b. Removing the resources when the CPU utilization goes under 60%
2. Create a load balancer to distribute the load between compute resources.
3. Route the traffic to the company's domain.

need to set the instance:

Connect the instance:

use the command the up the Apache server

.Update \$ sudo apt-get update.

Install Apache web \$ sudo apt-get install apache2 -y

To check open new tab copy and paste the public IP to browser APACHE 2 WEB

Check in Image tab of AMIs with a name of web-server-image

ami created

Create a auto scaling group

CPUUtilization > 80 for 1 datapoints within 5 minutes

CPUUtilization < 60 for 1 datapoints within 5 minutes

The screenshot shows the AWS CloudWatch Alarms console. A green banner at the top indicates "Successfully created alarm remove." The left sidebar shows the navigation menu with "Alarms" selected. The main content area displays a table of alarms.

☐	Name	State	Last state update	Conditions	Actions
☐	remove	In alarm	2024-04-14 19:12:57	CPUUtilization < 60 for 1 datapoints within 5 minutes	No action
☐	please	OK	2024-04-14 18:58:22	CPUUtilization > 80 for 1 datapoints within 5 minutes	Action

The screenshot shows the AWS Auto Scaling groups console. The left sidebar shows the navigation menu with "Auto Scaling groups" selected. The main content area displays a table of auto scaling groups.

☐	Name	Launch template/configuration	Instances	Status	Desired capacity	Min
☐	remove instance	Web-server-it Version Default	2	-	2	1
☐	web-server-asg	Web-server-it Version Default	2	-	2	1

a.Create Load balancer

created load balancer:

Copy and paste DNS of load balancer on the new browser and check apache2 web for two instances.
